

Dear Colleagues

Galileo Galilei, summarized what science means with an ingenious expression which has been considered the beginning of positive sciences hundreds of years ago, “Measure what is measurable, and make measurable what is not so”. In science nowadays there is only possible way to measure, which is statistics. Therefore JCOG will be organizing “SPSS Applied Basic and Intermediate Statistical Data Analysis Course” in October 2019. In our course you will also find tips on writing a scientific manuscripts, what you need to pay attention to when submitting articles to journals, what are the tips for facilitating the acceptance of the scientific article by the referees and editors, and the important tricks that are overlooked when creating the main basic skeleton of a manuscript, such as Consort Moose, in addition; how to do bibliography (bibliography) in thesis and articles and article search.

I hope that the course, which was first held in 2017 with great success, will be beneficial for all participants with a wider scope.

In this JCOG’s issue, we include articles from every section of Gynecology and Obstetrics. I would like to emphasize that your support is very important to make our journal more powerful by entering international indexes.

Best regards.

Çağrı Gülümser, MD
